As above, you can browse the site, you can search for the information. You can sign up to be a member, and you can edit your profile. A registered user or member can ask a question. Because you can see the questions and answers there is also an opportunity for discussion which in my view is a good thing. You will need to register an account on the website to be able to post a question and receive replies. To register click on "Register a new account". Software features, design, and system requirements are subject to change. The site has some discussion forums. Q: Running startup task from xcode build file? I'd like to be able to run a startup task from my build file. The purpose of this is to update a plist file each time the app is launched. I'd like to be able to specify that the startup task should be run on launch, and I'd like to be able to make the task run every build without doing it manually each time. If I put the task in my application delegate, when I run the app it loads the task, but the task always fails (even when I specify the error for the return path). If I put the task in my main xib file then it doesn't run on launch. Is it possible to use a build file to run a task on launch, and do it on every build without manually doing it? Is there some other approach I should be taking? I'd prefer a solution that doesn't require a Cocoa framework, but if that is the way to go I'd

appreciate some clarification. EDIT: Any reason why a task will always fail if it's triggered through a build file? Can I invoke the task somewhere other than directly through the build process? A: You can do something like this: INITIALIZE OR UPDATE How to use it in a build file? Create a target that builds your application, then check if a file named "__initialize_self__.build_state" exists. This file is created by the build system when a build target is configured to do it. Why __initialize_self__.build_state exists? When you first load your app from the built bundle, the file __initialize_self__.build_state is not there. Then, when you update the application using the built bundle, the f678ea9f9e
